## 2 Programming Overview

### 2.1 SCPI Command Overview

SCPI (Standard Commands for Programmable Instruments) is a standardized instrument programming language that is built upon the existing standard IEEE 488.1 and IEEE 488.2 and conforms to various standards, such as the floating point operation rule in IEEE 754 standard, ISO 646 7-bit coded character set for information interchange (equivalent to ASCII programming). The SCPI commands provide a hierarchical tree structure, and consist of multiple subsystems. Each command subsystem consists of one root keyword and one or more sub-keywords.

#### Syntax

The command line usually starts with a colon; the keywords are separated by colons, and following the keywords are the parameter settings available. The command ending with a quotation mark indicates querying a certain function and returns the query results. The keywords of the command and the first parameter are separated by a space.

For example,

```
:ACQuire:TYPE <type>  
:ACQuire:TYPE?
```

**ACQuire** is the root keyword of the command, **TYPE** is the second-level keyword. The command line starts with a colon ":" , and different levels of keywords are also separated by colons. **<type>** indicates a settable parameter. The command ending with a quotation mark "?" indicates querying a certain function. The command keywords **:ACQuire:TYPE** and the parameter **<type>** are separated by a space.

In some commands with parameters, "," is often used to separate multiple parameters. For example,

```
:SYSTem:DATE <year>,<month>,<day>
```

#### Symbol Description

The following symbols are not sent with the commands.

##### 1. Braces { }

The contents in the braces can contain one or multiple parameters. These parameters can be omitted or used for several times. Parameters are usually separated by the vertical bar "|". When using the command, you must select one of the parameters.

##### 2. Vertical Bar |

The vertical bar is used to separate multiple parameters. When using the command, you must select one of the parameters.

### 3. Square Brackets [ ]

The contents in the square brackets can be omitted.

### 4. Angle Brackets < >

The parameter enclosed in the angle brackets must be replaced by an effective value.

## Parameter Type

### 1. Bool

The parameter can be set to ON, OFF, 1, or 0. For example,

```
:SYSTem:BEEPer <bool>
```

```
:SYSTem:BEEPer?
```

Wherein, <bool> can be set to {{1|ON}|{0|OFF}}. The query returns 1 or 0.

### 2. Discrete

The parameter can be any of the values listed. For example,

```
:SYSTem:PStatus <sat>
```

```
:SYSTem:PStatus?
```

Wherein,

- <sat> can be set to DEFault|OPEN.
- The query returns an abbreviated form: DEF or OPEN.

### 3. Integer

Unless otherwise specified, the parameter can be any integer (NR1 format) within the effective value range.

#### CAUTION

**Do not set the parameter to a decimal, otherwise, errors will occur.**

For example,

```
:DISPLAY:GBrightness <brightness>
```

```
:DISPLAY:GBrightness?
```

Wherein, <brightness> can be set to an integer ranging from 1 to 100. The query returns an integer ranging from 1 to 100.

### 4. Real

The parameter can be any real number within the effective value range, and this command accepts parameter input in decimal (NR2 format) and scientific notation (NR3 format). For example,

```
:TRIGger:TIMEout:TIME <time>  
:TRIGger:TIMEout:TIME?
```

Wherein, <time> can be set to any real number ranging from 1.6E-8 (16 ns) to 1E +1 (10 s). The query returns a real number in scientific notation.

## 5. ASCII String

The parameter can be the combinations of ASCII characters. For example,

```
:LAN:GATEway <string>
```

Wherein, <string> can be set to

```
192.168.1.1
```

## Command Abbreviation

The keywords of all the commands are case-insensitive. They can all be in upper case or in lower case. If an abbreviation is used, you must input all the capital letters in the command. For example,

```
:DISPLAY:GBrightness?
```

can be abbreviated as

```
:DISP:GBR?
```

## 2.2

## Remote Control

This instrument can be connected to the PC via the USB, or LAN interface to set up communication and realize remote control through the PC. The remote control can be realized by using SCPI (Standard Commands for Programmable Instruments) commands.

### PC Software

Users usually need to use the PC software to send commands to control the instrument remotely. RIGOL Ultra Sigma is recommended. When the instrument is connected to the PC via the USB, or LAN interface, the Ultra Sigma software can search for instrument resources and enable command interaction.

Log in to the RIGOL official website. Click **Support** and select **Soft/Firmware** to obtain the Ultra Sigma software package and help documentation.

### Web Control

When the instrument is connected to the PC via the LAN interface, you can use Web Control to send SCPI commands from the PC to the instrument.

The operation procedures are as follows:

1. Obtain the instrument's IP address and input it in the browser address bar to log in to the Web Control page.
2. After you enter the Web Control interface, click the "SCPI Panel Control" button to enter the SCPI Command interface.
3. Input the specified SCPI command and then click **Send & Read** to send the command. The operation process and the returned value will be displayed in the current interface.

## 2.2.1 Remote Control via USB

### 1. Connect the device

Use the USB cable to connect the rear-panel USB DEVICE interface of the instrument to the USB HOST interface of the PC.

### 2. Search for the device resource

Start up Ultra Sigma and the software will automatically search for the resource currently connected to the PC via the USB interface. You can also click **USB-TMC** to search for the resource.

### 3. View the device resource

The resources found will appear under the "RIGOL Online Resource" directory, and the model number and USB interface information of the instrument will also be displayed.

### 4. Control the instrument remotely

Right-click the device resource name and select "SCPI Panel Control" to open the remotely command control panel. Then you can send commands and read data through the panel. For details about the SCPI commands and programming, refer to the Programming Guide of this instrument.

## 2.2.2 Remote Control via LAN

### 1. Connect the device

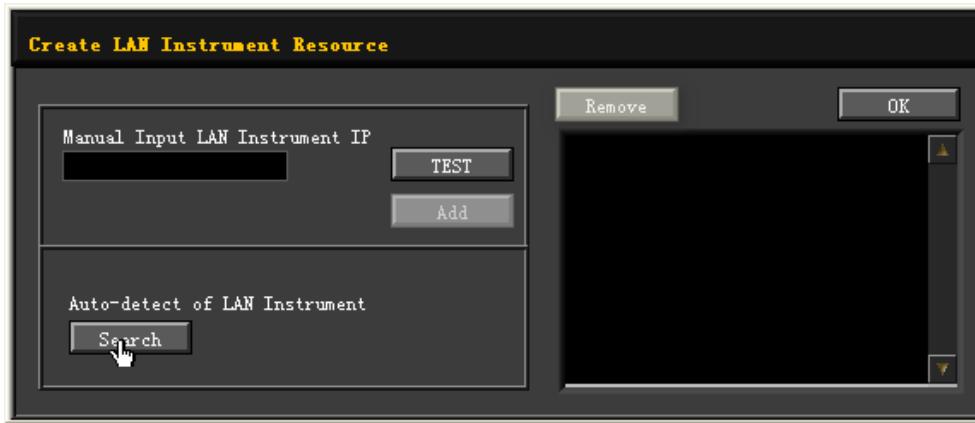

Use the network cable to connect the instrument to your local area network (LAN).

### 2. Configure network parameters

Configure the network parameters of the instrument in **Utility>IO** menu.

### 3. Search for Search device resource

Start up Ultra Sigma and click **LAN** to open the panel as shown in the figure below. Click **Search** and the software searches for the instrument resources currently connected to the LAN and the resources found are displayed at the right section of the window as shown in the figure below. Click **OK** to add it.

Besides, you can input the IP address of the instrument manually into the text field under "Manual Input LAN Instrument IP", then click **TEST**. If the instrument passes the test, click **Add** to add the instrument to the LAN instrument resource list in the right section; if the instrument fails the test, please check whether the IP address that you input is correct, or use the auto search method to add the instrument resource.

#### 4. View the device resource

The resources found will appear under the "RIGOL Online Resource" directory.

#### 5. Control the instrument remotely

Right-click the device resource name and select "SCPI Panel Control" to open the remotely command control panel. Then you can send commands and read data through the panel.

#### 6. Load LXI webpage

As this instrument conforms to LXI CORE 2011 DEVICE standards, you can load LXI web page through Ultra Sigma (right-click the instrument resource name and select "LXI-Web"). Various important information about the instrument (including the model, manufacturer, serial number, description, MAC address, and IP address) will be displayed on the web page. You can also directly input the IP address of the instrument in the address bar of the PC browser to load the LXI web page.

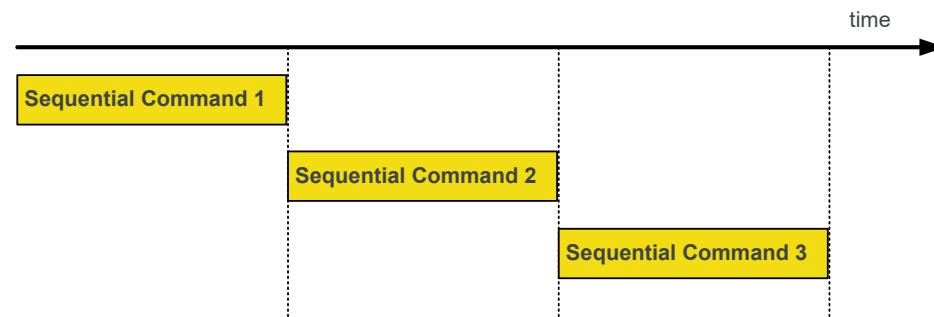

## 2.3 Sequential Commands and Overlapped Commands

IEEE488.2 defines the differentiation between the Sequential commands and the Overlapped commands.

- **Sequential Commands**

Commands that shall be executed in sequence. Before completing the execution of one sequential command, another command shall not be executed. A command is a Sequential Command when Execution Control waits for the resulting device action to complete before it initiates the next device action.

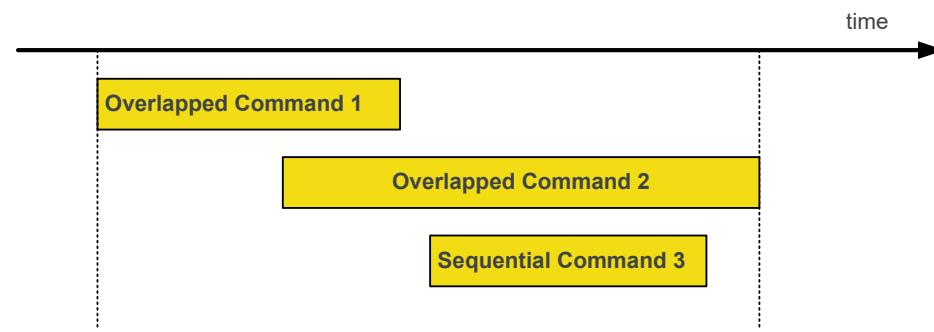

The following figure shows the example of the sequence order for the sequential command.

- **Overlapped Commands**

Commands that can be executed with several other commands being executed in parallel. During the execution process, several commands may be overlapped with each other. An overlapped command is a command that allows execution of subsequent commands while the device operations initiated by that overlapped command are still in progress.

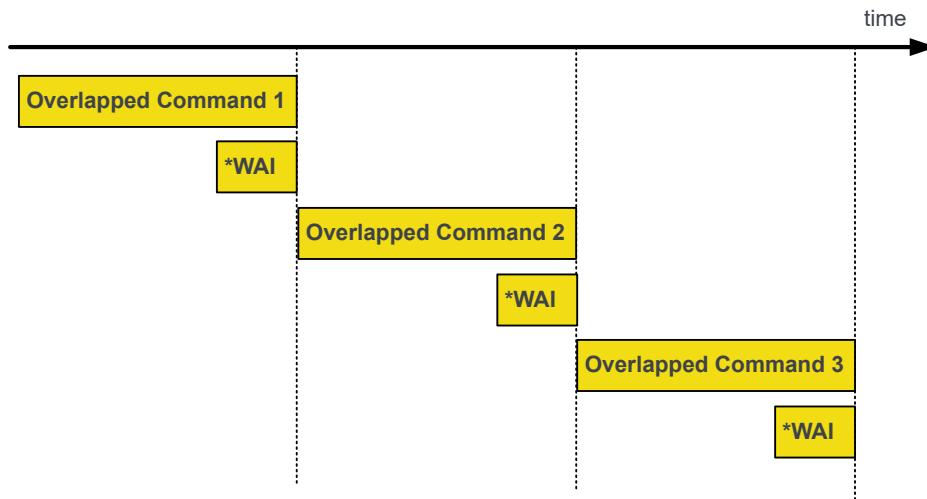

The following figure shows the example of the sequence order for the overlapped command.

To ensure that the instrument functions can be synchronized through the commands executed in the specified order and query the command execution status, IEEE488.2 defines three general commands (\*WAI, \*OPC, and \*OPC?) to check the operation complete (OPC) function of the instrument.

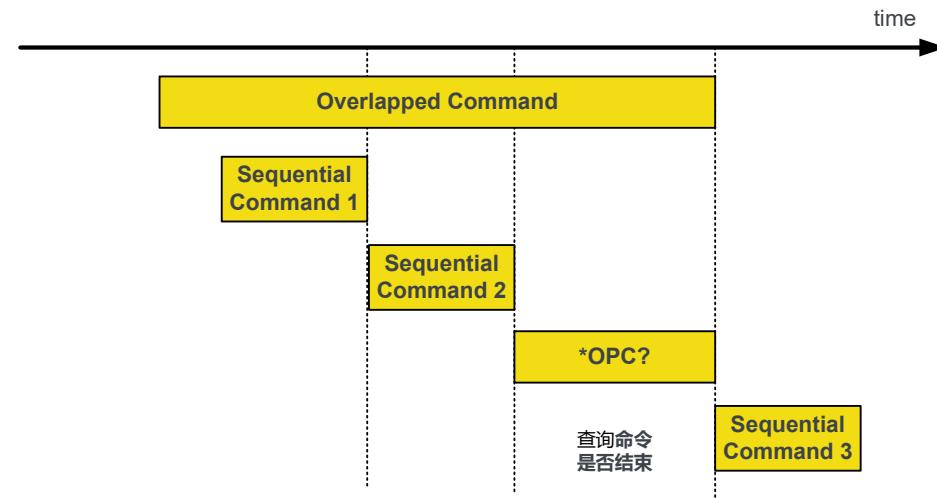

- **\*WAI:** The \*WAI command shall prevent the instrument from executing further commands or queries until all the received commands have been completely executed. The \*WAI command will not operate on the register.

If you want the overlapped commands to be executed in sequence just like the sequential commands, you can send the \*WAI command before or after the specified overlapped command. For example,

- **\*OPC:** Upon receiving the \*OPC command, the instrument will wait until all the previously received commands have been completely executed. Meanwhile, it will set Bit 0 in the *Standard Event Register* to 1, and then execute the following commands.
- **\*OPC?:** Upon receiving the \*OPC? Command, the instrument will query whether all the previous received commands have been completely executed. If completed, the query returns 1; if not, it will wait until all the pending operations have been completed and then returns 1. The \*OPC? command shall not operate on the register.

If you want to query the execution status of a series of commands and control the execution sequence of the command, send the \*OPC? Command. For example,

The following table lists the overlapped commands that support the Operation Complete (OPC) function. While using the overlapped commands, pay attention to the execution order of the command to avoid causing any abnormalities to the results.

Command	Constraint Condition
*RST	-

## 2.4 Compatible Commands

Compatible commands refer to the commands exist for backwards compatibility. After the syntax of the command has been updated to a new version, its old version can still be used and executed.

The following table lists the commands that exist for backwards compatibility and the new commands.

## 3.7 :ACQuire Commands

The **:ACQuire** commands are used to set the memory depth of the oscilloscope, the acquisition mode, the average times, as well as query the current sample rate.

### 3.7.1 :ACQuire:AVERages

#### Syntax

```
:ACQuire:AVERages <count>  
:ACQuire:AVERages?
```

#### Description

Sets or queries the number of averages in the average acquisition mode.

**Parameter**

Name	Type	Range	Default
<count>	Integer	$2^n$ (n is an integer, and its range is from 1 to 16).	2

**Remarks**

- You can send the **:ACQuire:TYPE** command to set the acquisition mode.
- In the average acquisition mode, greater number of averages can lower the noise and increase the vertical resolution; but will also slow the response of the displayed waveform to the waveform changes.
- The number of averages must be in the Nth power of 2. When the value is not in the Nth power of 2, a value that is smaller than the one you input and the closest to the N power-of-2 increments will be input automatically. For example, if you input 9 with the numeric keypad, the average count will be input 8 automatically.

**Return Format**

The query returns an integer ranging from 2 to 65536.

**Example**

```
:ACQuire:AVERages 128      /*Sets the average times to 128.*/
:ACQuire:AVERages?        /*The query returns 128.*/
```

## 3.7.2 :ACQuire:BITS

**Syntax**

```
:ACQuire:BITS <bit>
:ACQuire:BITS?
```

**Description**

Sets or queries the resolution bits supported by the oscilloscope in high-resolution mode.

**Parameter**

Name	Type	Range	Default
<bit>	Discrete	{14 16}	14

**Remarks**

This oscilloscope supports 14 bits and 16 bits in high-resolution mode; 12 bits in other modes.

**Return Format**

The query returns the resolution bits in integer. Its unit is bit.

**Example**

```
:ACQuire: BITS 16      /*Sets the resolution in high-resolution mode
to 16 bits.*/
:ACQuire: BITS?          /*The query returns 16.*/
```

### 3.7.3 :ACQuire:MDEPth

**Syntax**

```
:ACQuire:MDEPth <mdep>
:ACQuire:MDEPth?
```

**Description**

Sets or queries the memory depth of the oscilloscope (that is, the number of waveform points that can be stored through the sampling in a single trigger). The default unit is pts.

**Parameter**

Name	Type	Range	Default

**Remarks**

When AUTO is selected, the oscilloscope selects the memory depth automatically according to the current sample rate.

The max. memory depth is 500 Mpts in half-channel mode and 250 Mpts in full-channel mode.

- CH1 and CH3 are considered as one group; CH2 and CH4 are considered as another group.
- When only one of the channels in each group is enabled, or when both channels in either group are enabled, the memory depths available include Auto, 1 kpts, 10 kpts, 100 kpts, 1 Mpts, 10 Mpts, 25 Mpts, 50 Mpts, 100 Mpts, 125 Mpts, 200 Mpts, 250 Mpts, and 500 Mpts.
- When one or two channels in either group are both enabled, the memory depths available include Auto, 1 kpts, 10 kpts, 100 kpts, 1 Mpts, 10 Mpts, 25 Mpts, 50 Mpts, 100 Mpts, 125 Mpts, 200 Mpts, and 250 Mpts.

Modifying the memory depth will affect the sample rate. To query the current sample rate, run the [:ACQuire:SRATe?](#) command.

#### Return Format

The query returns the memory depth in scientific notation.

#### Example

```
:ACQuire:MDEPth 1M          /*Sets the memory depth to 1M.*/

### 3.7.5 :ACQuire:TYPE

#### Syntax

```
:ACQuire:TYPE <type>  
:ACQuire:TYPE?
```

#### Description

Sets or queries the acquisition mode of the oscilloscope.

#### Parameter

Name	Type	Range	Default
<type>	Discrete	{NORMAl PEAK AVERages HRESolution}	NORMAl

#### Remarks

- **NORMAl:** In this mode, the oscilloscope samples the signal at a specified fixed time interval to rebuild the waveform. For most of the waveforms, using this mode can produce the optimal display effects.
- **AVERages:** In this mode, the oscilloscope averages the waveforms from multiple samples to reduce the random noise of the input signal and improve the vertical resolution. Greater number of averages can lower the noise and increase the vertical resolution; while at the same time, it will slow the response of the displayed waveform to the waveform changes.
- **PEAK:** indicates the peak detection. In this mode, the oscilloscope samples the maximum and minimum value of the signal at the fixed sampling interval to acquire the signal envelope or the narrow pulses that might be lost. In this mode, signal aliasing can be prevented, but the noise displayed would be larger.
- **HRESolution:** indicates high resolution. The oscilloscope will average the adjacent sample points of the sample waveform to lower the random noises of the input signals and display much more smoother waveforms. If the sample rate of the digital converter is greater than the storage rate of the acquisition memory, this mode is often adopted.

### Return Format

The query returns NORM, PEAK, AVER, HRES.

### Example

```
:ACQuire:TYPE AVERages      /*Sets the acquisition mode to Average.*/

## 3.10 :CHANnel<n> Commands

The :CHANnel<n> commands are used to set or query the bandwidth limit, coupling, vertical scale, vertical offset, and other vertical system parameters of the analog channel.

- Setting the bandwidth limit can reduce the noises in the displayed waveforms. For example, the signal under test is a pulse with high frequency oscillation. When the bandwidth limit is turned off, the high frequency components of the signal under test can pass the channel. When the bandwidth limit is turned on, the high frequency components found in the signal under test that are greater than the limit are attenuated.
- You can remove unwanted signals by setting the coupling mode. For example, the signal under test is a square waveform with DC offset. AC coupling mode can block the DC components.
- When you use an oscilloscope to make actual measurements, a small offset that arises from the temperature drift of the component or external environment disturbance may occur on the zero-cross voltage of the channel, which will affect the measurement results of the vertical parameters. This series oscilloscope allows you to set an offset calibration voltage for calibrating the zero point of the corresponding channel so as to improve the accuracy of the measurement results.
- When the fine adjustment is enabled, you can further adjust the vertical scale within a relatively smaller range to improve vertical resolution, making it easier to view waveform details.

### 3.10.1 :CHANnel<n>:BWLimit

#### Description

Sets or queries the bandwidth limit of the specified channel.

- When the vertical scale is greater than 500  $\mu$ V, the bandwidth limit is disabled. When vertical scale is greater than 200  $\mu$ V/div but equal to or smaller than 500  $\mu$ V, the 250 MHz bandwidth limit is enabled automatically and bandwidth limit cannot be disabled. When the vertical scale is equal to 200  $\mu$ V, the 20 MHz bandwidth limit is enabled automatically and bandwidth limit cannot be disabled. ## 3.12 :CURSor Commands

The **Cursor** commands are used to measure the X axis values (e.g. Time) and Y axis values (e.g. Voltage) of the waveform on the screen.

Before making cursor measurements, connect the signal to the oscilloscope to acquire stable display. The cursor measurement function provides the following two cursors.

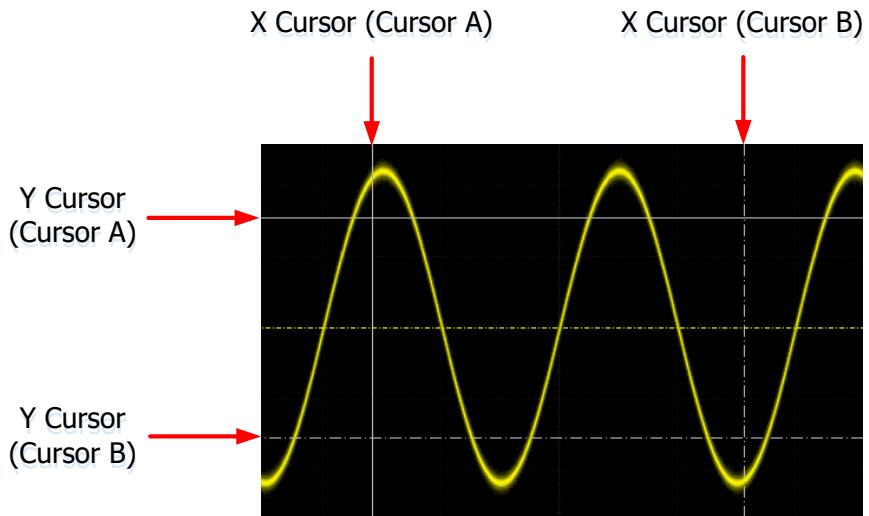

Figure 3.6 Cursors

- **X Cursor**

X cursor is a vertical solid/dotted line that is used to make horizontal adjustments. It can be used to measure time (s) and frequency (Hz).

- Cursor A is a vertical solid line and Cursor B is a vertical dotted line.
- In the XY cursor mode, cursor X is used to measure the waveform amplitude of CH1.

- **Y Cursor**

Y cursor is a horizontal solid/dotted line that is used to make vertical adjustments. It can be used to measure amplitude (the unit is the same as that of the source channel amplitude).

- Cursor A is a horizontal solid line and Cursor B is a horizontal dotted line.
- In XY cursor mode, cursor Y is used to measure the waveform amplitude of CH2.

## Cursor Measurement Results

- AX: indicates the X value at Cursor A.
- AY: indicates the Y value at Cursor A.
- BX: indicates the X value at Cursor B.
- BY: indicates the Y value at Cursor B.
- $\Delta X$ : indicates the horizontal spacing between Cursor A and Cursor B.
- $\Delta Y$ : indicates the vertical spacing between Cursor A and Cursor B.
- $1/\Delta X$ : indicates the reciprocal of the horizontal spacing between Cursor A and Cursor B.

## Cursor Mode

- **Manual Mode**

In the manual cursor mode, you can adjust the cursor manually to measure the value of the waveforms of the specified source at the current cursor. If the settings for the parameter such as the cursor type and measurement source are different, the measurement results will be different for cursor measurement.

- **Track Mode**

In the Track mode, you can adjust the two pairs of cursors (Cursor A and Cursor B) to measure the X and Y values on two different sources respectively. When the cursors are moved horizontally/vertically, the markers will position on the waveform automatically. When the waveform is expanded or compressed horizontally/vertically, the markers will track the points being marked at the last adjustment of the cursors.

- **XY Mode**

By default, XY mode is unavailable. It is available only when the horizontal time base mode is "XY".

## 3.16 IEEE488.2 Common Commands

The IEEE488.2 common commands are used to query the basic information of the instrument or executing basic operations. These commands usually start with "\*", and the command keywords contain 3 characters and are related with status registers.

The standard event status register (SESR) and status byte register (SBR) record the event of a certain type happened during the use of the instrument. IEEE488.2 defines to record one specific type of event for each bit in the status register.

**Table 3.159 Table of the Bit Definition of Standard Event Status Register**

Bit No.	Bit Name	Decimal Value	Description
0	Operation Complete (OPC)	1	"Operation complete" indicates that all pending operations were completed following the execution of the command.
1	Not Used	2	-
2	Query Error (QYE)	4	The instrument tries to read the output buffer but it was empty. Or, a new command line was received before a

Bit No.	Bit Name	Decimal Value	Description
			previous query has been read. Or, both the input buffer and output buffer are full.
3	Device-Specific Error (DDE)	8	Indicates that an error has occurred that is neither a Command Error, a Query Error, nor an Execution Error. A Device-Specific Error is any executed device operation that did not properly complete due to some condition, such as self-check error, calibration error, or other device-specific errors.
4	Execution Error (E)	16	An execution error occurred.
5	Command Error (CME)	32	A command error (command syntax error) has occurred.
6	Not Used	64	-
7	Power On (PON)	128	Indicates that an off-to-on transition has occurred in the device's power supply since last reading or the event register was cleared.

**3.20 :MATH<n> Commands**

**:MATH<n>** commands are used to set various math operation function of the waveform between channels.

This series oscilloscopes can realize multiple math operations between waveforms of different channels, including arithmetic operation, function operation, FFT operation, logic operation, and digital filter.

**Operator****Arithmetic Operation**

The arithmetic operations supported by this oscilloscope include A+B, A-B, A×B, and A÷B.

- **A+B** adds the waveform voltage values of signal source A and B point by point and displays the results.
- **A-B** subtracts the waveform voltage values of signal source B from that of source A point by point and displays the results.
- **A×B** multiplies the waveform voltage values of signal source A and B point by point and displays the results.
- **A÷B** divides the waveform voltage values of signal source A by that of source B point by point and displays the results. It can be used to analyze the Multiple relation of the two channels waveforms. When the voltage of signal source B is 0 V, the division result is treated as 0.

### Function Operation

The available function operation types of this oscilloscope include Intg, Diff, Sqrt, Lg (Base 10 Exponential), Ln, Exp, Abs, and AX+B.

- **Intg:** calculates the integral of the selected source. For example, you can use integral to measure the area under a waveform or the pulse energy.
- **Diff:** calculates the discrete time derivative of the selected source. For example, you can use differentiate to measure the instantaneous slope of a waveform.
- **Sqrt:** calculates the square roots of the selected source point by point and displays the results.
- **Lg (Base 10 Exponential):** calculates the base 10 exponential of the selected source point by point and displays the results.
- **Ln:** calculates the natural logarithm (Ln) of the selected source point by point and displays the results.
- **Exp:** calculates the exponential of the selected source point by point and displays the results.
- **Abs:** calculates the absolute value of the selected source and displays the results.
- **AX+B:** applies a linear function to the selected source, and displays the results.

### FFT Operation

FFT (Fast Fourier Transform) is used to transform time-domain signals to frequency-domain components (frequency spectrum). This oscilloscope provides FFT operation function which enables you to observe the time-domain waveform and spectrum of the signal at the same time. FFT operation can facilitate the following works:

- Measure harmonic components and distortion in the system;
- Display the characteristics of the noise in DC power;
- Analyze vibration.

**Table 3.196 Window Function**

Window Function	Characteristics	Waveforms Applicable to the Window Function
Rectangular	Best frequency resolution Poorest amplitude resolution Similar to the situation when no window is applied	Transient or short pulse, the signal levels before and after the multiplication are basically the same  Sine waveforms with the same amplitudes and rather similar frequencies  Wide band random noise with relatively slow change of waveform spectrum
Blackman-Harris	Best amplitude resolution Poorest frequency resolution	Single frequency signal, searching for higher order harmonics
Hanning	Better frequency resolution and poorer amplitude resolution compared with Rectangular	Sine, periodic, and narrow band random noise
Hamming	A little bit better frequency resolution than Hanning	Transient or short pulse, the signal levels before and after the multiplication are rather different
Flattop	Measure the signals accurately	Measure the signal that has no accurate reference and requires an accurate measurement
Triangle	Better frequency resolution	Measure the narrow band signal and that has strong noise interference

Spectral leakage can be considerably minimized when a window function is used. The oscilloscope provides 6 FFT window functions which have different characteristics and are applicable to measure different waveforms, as shown in the table below. You need

to select the window function according to the characteristics of the waveform to be measured.

### Logic Operation

The logic operations supported by this oscilloscope include A&&B, A||B, A^B, and !A. The results of logic operation of one binary bit are shown in the table below:

**Table 3.197 Logic Operation Results**

A	B	A&&B	A  B	A^B	!A
0	0	0	0	0	1
0	1	0	1	1	1
1	0	0	1	1	0
1	1	1	1	0	0

### Digital Filter

The digital filters supported by this oscilloscope include: low-pass filter, high-pass filter, band-pass filter, and band-stop filter.

- **LowPass** only allows the signals whose frequencies are lower than the current upper limit frequency to pass.
- **HighPass** only allows the signals whose frequencies are higher than the current lower limit frequency to pass.
- **BandPass** only allows the signals whose frequencies are higher than the current lower limit frequency and lower than the current upper limit frequency to pass.
- **BandStop** only allows the signals whose frequencies are lower than the current lower limit frequency or higher than the current upper limit frequency to pass.

## 3.31 :TIMEbase Commands

:TIMEbase commands are used to set the horizontal system. For example, you can enable the Zoom mode or set the horizontal time base mode.

**Horizontal Time Base Mode**

- **YT Mode:** By default, this series oscilloscope uses the YT mode for waveform display window. In YT mode, Y-axis indicates the Voltage and X-axis indicates the Time.

- **XY Mode:** In XY mode, both the X-axis and Y-axis indicate voltage. The XY mode converts the oscilloscope from a "Voltage-Time" display to a "Voltage-Voltage" display using two input channels. The XY mode can be used to measure the phase deviation occurred when the signal under test passes through a circuit network.
- **Roll Mode:** The roll mode causes the waveform to move across the screen from right to left. It allows you to view the acquired data without waiting for a complete acquisition. The Roll mode is automatically enabled when the horizontal time base is set to 50 ms/div or slower.

**TIP**

- If the Zoom mode is currently turned on, enabling the roll mode automatically turns off the Zoom mode.
- The following functions are not available when the roll mode is enabled: To Adjust the Horizontal Position (available when the oscilloscope run state is STOP), Zoom Mode (Delayed Sweep), Triggering the Oscilloscope, Protocol Decoding, Pass/Fail Test, Waveform Recording and Playing, Persistence Time, XY Mode, and Average.

### 3.31.1 :TIMEbase:DElay:ENABLE

**Parameter**

Name	Type	Range	Default
<scale>	Real	Refer to <i>Remarks</i>	-

**Remarks**

- The maximum value of the parameter <scale> is the current scale of the main time base.
- The delayed time base scale can only be the maximum value or the values acquired by reducing the maximum value at 1-2-5 step. If the minimum value calculated according to the above formula is not one of the settable values, take the minimum settable value that is greater than the minimum value calculated.
- The default value of the delayed time base scale is determined by the scale in Main mode and its value is the next scale value in Main mode.

```

**3.32.12 :TRIGger:PATTERn**

The pattern trigger identifies a trigger condition by looking for a specified pattern. This pattern is a logical "AND" combination of channels. Each channel can be set to H (high), L (low), or X (don't care). A rising or falling edge (you can only specify a single edge) can be specified for one channel included in the pattern. When an edge is specified, the oscilloscope will trigger at the edge specified if the pattern set for the other channels are true (namely the actual pattern of the channel is the same as the preset pattern). If no edge is specified, the oscilloscope will trigger on the last edge that makes the pattern true. If all the channels in the pattern are set to "X", the oscilloscope will not trigger.

### 3.32.12.1 :TRIGger:PATTERn:PATTERn

#### Syntax

:TRIGger:PATTERn:PATTERn <pch1>[,<pch2>[,<pch3>[,<pch4>]]]

:TRIGger:PATTERn:PATTERn?

#### Description

Sets or queries the channel pattern of Pattern trigger.

#### Parameter

Name	Type	Range	Default
<pch1>	Discrete	{H L X R F}	X
<pch2>	Discrete	{H L X R F}	X
<pch3>	Discrete	{H L X R F}	X
<pch4>	Discrete	{H L X R F}	X

#### Remarks

- The parameter "<pch1> to <pch4>" sets the patterns of the analog channels "CHANnel1 to CHANnel4".
- In the parameter range, H indicates high level (higher than the threshold level of the channel), L indicates low level (lower than the threshold level of the channel), and X indicates omitting the channel (This channel is not used as a part of the pattern. When all the channels are set to X, the oscilloscope will not trigger.) R indicates rising edge, and F indicates falling edge.
- In the pattern, you can only specify one edge (rising edge or falling edge). If one edge item is currently defined and then another edge item is defined in

another channel in the pattern, then a prompt message "Invalid input" is displayed. Then, the latter defined edge item will be replaced by X.

### Return Format

The query returns the currently set pattern of all the channels. The channels are separated by commas.

### Example

```
:TRIGger:PATTern:PATTern H,R,L,X /*Sets the patterns of "CHANnel1 to CHANnel4" to H,R,L,X.*/
:TRIGger:PATTern:PATTern? /*The query returns H,R,L,X.*/

## 3.32.20 :TRIGger:RS232

RS232 bus is a serial communication mode used in data transmission between PCs or between a PC and a terminal. In RS232 serial protocol, a character is transmitted as a frame of data. The frame consists of 1 start bit, 5-8 data bits, 1 check bit, and 1-2 stop bits. Its format is as shown in the figure below. This series oscilloscope triggers when the start frame, error frame, check error, or the specified data of the RS232 signal is detected.

I2C is a 2-wire serial bus used to connect the microcontroller and its peripheral device. It is a bus standard widely used in the microelectronic communication control field.

The I2C serial bus consists of SCL and SDA. Its transmission rate is determined by SCL, and its transmission data is determined by SDA, as shown in the figure below. The instrument series triggers on the start condition, restart, stop, missing acknowledgment, specific device address, or data value. Besides, it can also trigger on the specific device address and data values at the same time.

## 3.33 :WAVeform Commands

The **:WAVeform** commands are used to read waveform data and relevant settings. The **:WAVeform:MODE** command is used to set the reading mode of waveform data. In different modes, the definitions for the parameters are different, as shown in [Figure 3.15](#) and [Figure 3.16](#).

**Figure 3.15 Parameter Definitions in NORMAL Mode**

**Figure 3.16 Parameter Definitions in RAW Mode**

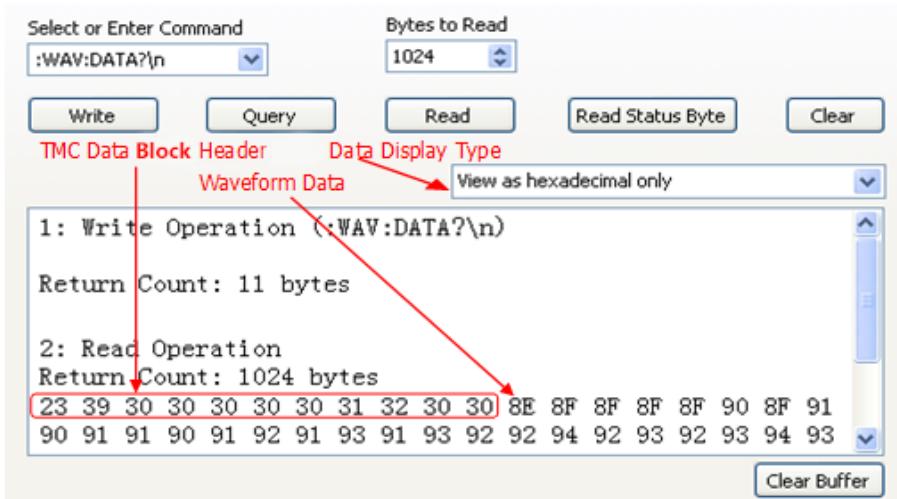

#### NOTE

[1]: In RAW mode, YINCrement and Verticalscale of the memory waveforms are related to the currently selected Verticalscale.

#### Waveform data reading

- **WORD or BYTE format:** The read data format is TMC header + waveform data points + end identifier. The TMC header is in #NXXXXXX format; wherein, # is the TMC header identifier; N following # represents the length of the waveform data; the length of the waveform data points is expressed in ASCII strings, and the terminator represents the ending of communication. For example, the data read for one time is #9000001000XXXX. It indicates that 9 bytes are used to describe the data length. 000001000 indicates the length of waveform data, that is, 1,000 bytes.
- **ASCII format:** The read data format is waveform data points + end identifier. The waveform data point query returns the actual voltage value of each waveform point in scientific notation; and the voltage values are separated by commas.

- When the waveform data in the internal memory are read in batches, the waveform data returned each time might be the data in one area of the internal memory. In "WORD" or "BYTE" return format, each returned data in blocks contain the TMC data block header. Waveform data in two adjacent data blocks are consecutive.
- The figure below shows the waveform data that have been read (in BYTE format). First, select "View as hexadecimal only" from the drop-down list at the right side. Then, the waveform data that have been read are displayed in hexadecimal format. The first 11 bytes denote the "TMC data block header", and beginning from the 12th byte (8E) are the waveform data. You can convert the waveform data read to the voltage value of each point of the waveform by using the formula " $(0x8E - YORigin - YREFerence) \times YINCrement$ ". For the definitions of the parameters in this formula, refer to [Related Commands](#).

## 4 Application Examples

This chapter provides some application examples of the SCPI commands. The main functions of the instrument can be realized through a series of SCPI commands.

### NOTE

- The range of certain parameters for different models may be different. Therefore, you need to adjust the parameter range for the model that you use if necessary.
- Before using the examples in this chapter, please select the desired communication interface (USB or LAN) and make correct connections. In addition, you have to install Ultra Sigma or other PC software that can be used to send commands.
- In each example, every command is followed by contents enclosed by two slashes ("/\*" and "\*/"). They are the descriptions of the command and not part of the command, which help you understand the command better.

## 5 Programming Examples

This chapter illustrates how to control the instrument by programming in LabVIEW, Visual Basic, and Visual C++. These examples are programmed based on Virtual Instrument Software Architecture (VISA) library.

RIGOL official website (<http://www.rigol.com>) provides the programming examples based on LabVIEWk, Visual Basic, Visual C++, Matlab, and Python. You can go to the official website and click **SUPPORT > Programming Demo** to obtain the programming examples.

### 5.1 Programming Preparations

Before programming, you need to prepare the following tasks:

You can log in to the RIGOL official website (<http://www.rigol.com>) to download the software. Then install the software according to the installation wizard. After Ultra Sigma is installed successfully, NI-VISA library will be completely installed automatically. In this manual, the default installation path is C:\Program Files\IVI Foundation\VISA.

In the manual, the instrument communicates with the PC via the USB interface. Connect the USB Device interface on the rear panel of the instrument to the PC by using the USB cable. After the instrument is properly connected to the PC, power on the instrument to start it.

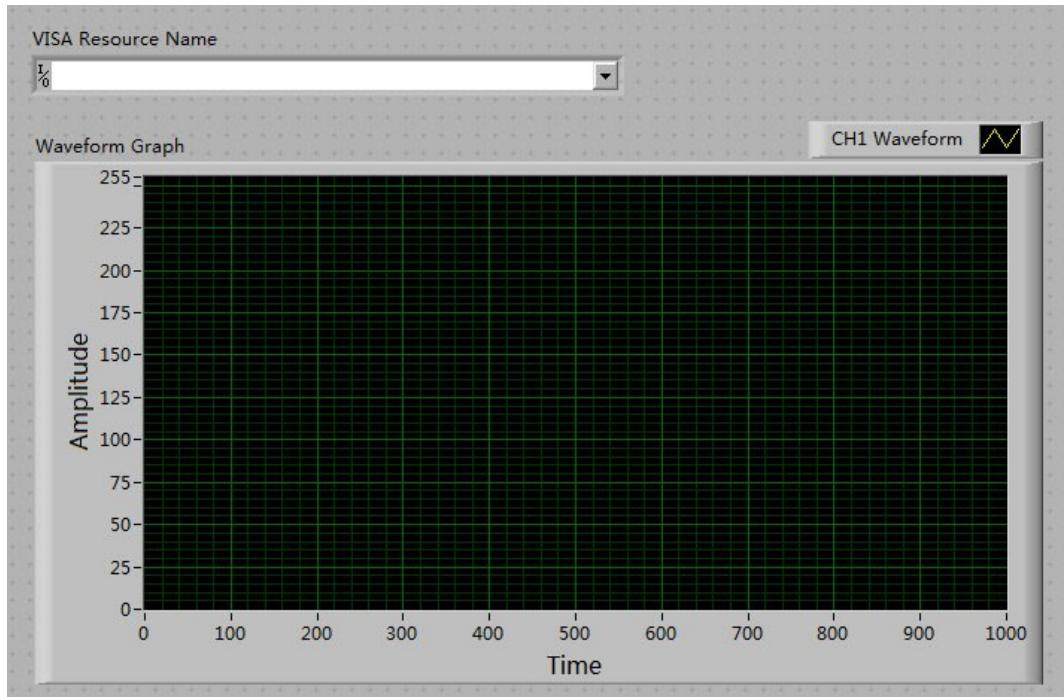

The following parts will make a detailed introduction about the programming examples in LabVIEW, Visual Basic, and Visual C++.

### 5.2 LabVIEW Programming Example

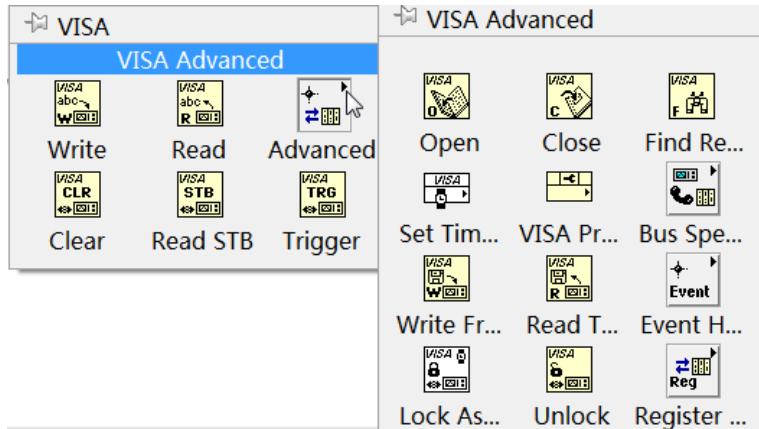

**Program used in this example:** LabVIEW2010

**Function realized in this example:** reading the waveform data of CH1 on the screen.

1. Run LabVIEW, and then create a VI file named LabVIEW\_Demo.
2. Add controls and create the front panel as shown in the figure below.

3. Open the Block Diagram panel. Click **Instrument I/O > VISA**. Add the following functions: VISA Open, VISA Read, VISA Write, and VISA Close.

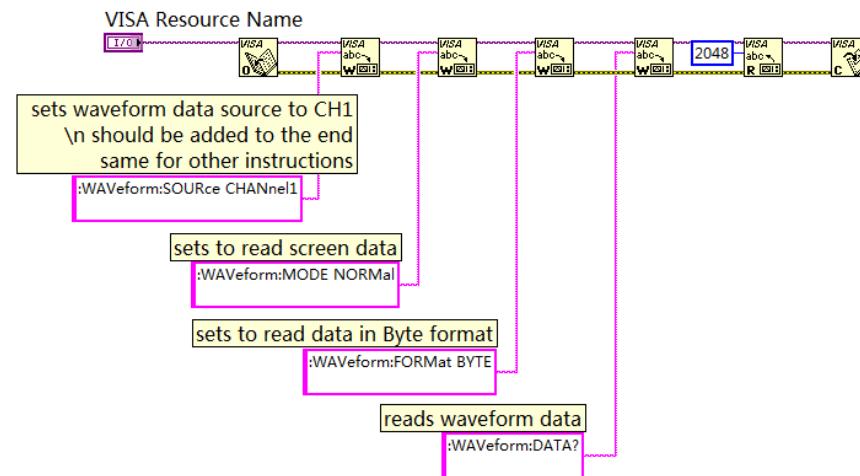

4. Connect the VISA resource name with the VISA Open. Then, connect the VISA resource name outputs of all the functions with the VISA resource name and connect the error output with the error input, as shown in the figure below.

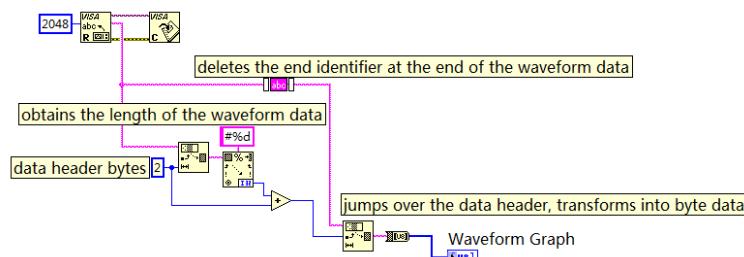

5. Add string constant in the write buffer areas of the VISA Write function and input the following instructions in the figure below. Waveform data is read through the

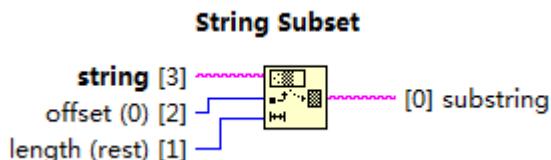

VISA Read function which requires users to input the total number of bytes to be read. In this example, the total number of bytes of waveform data to be read is less than 2048. Use the VISA Close function to close the VISA resource after the VISA operation is finished.

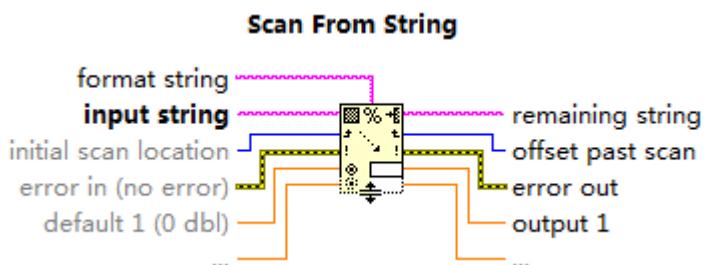

6. The data format is TMC data block header + waveform data + terminator. The TMC header is in #NXXXXXX format; wherein, # is the TMC header identifier; N following # represents the length of the waveform data; the length of the waveform data points is expressed in ASCII strings, and the terminator represents the ending of communication. For example, the data read for one time is #9000001000XXXX. It indicates that 9 bytes are used to describe the data length. 000001000 indicates the length of waveform data, that is, 1,000 bytes. Use the following block diagram to obtain the number of bytes that the TMC header occupies. Ignore the TMC header and delete the terminator at the end of the waveform data, and transfer the waveform data to the byte data and display it on the waveform diagram controls.

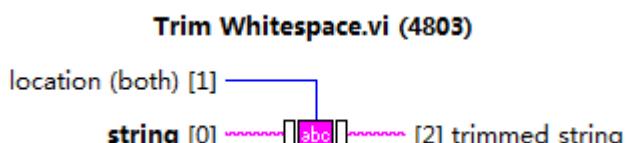

The available functions used in the above block diagram are as follows:

Used to obtain the TMC header "#N". After obtaining the number of bytes that the TMC header occupies, ignore the data header to obtain the waveform data strings

Used to obtain the waveform data length bytes

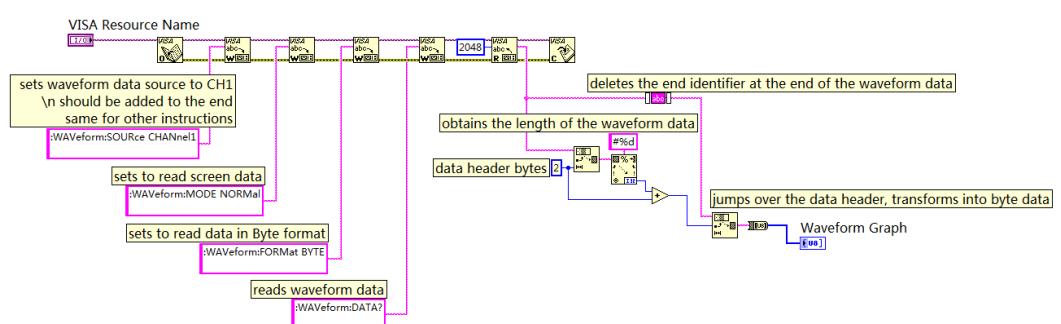

Used to delete the terminator at the end of the waveform data

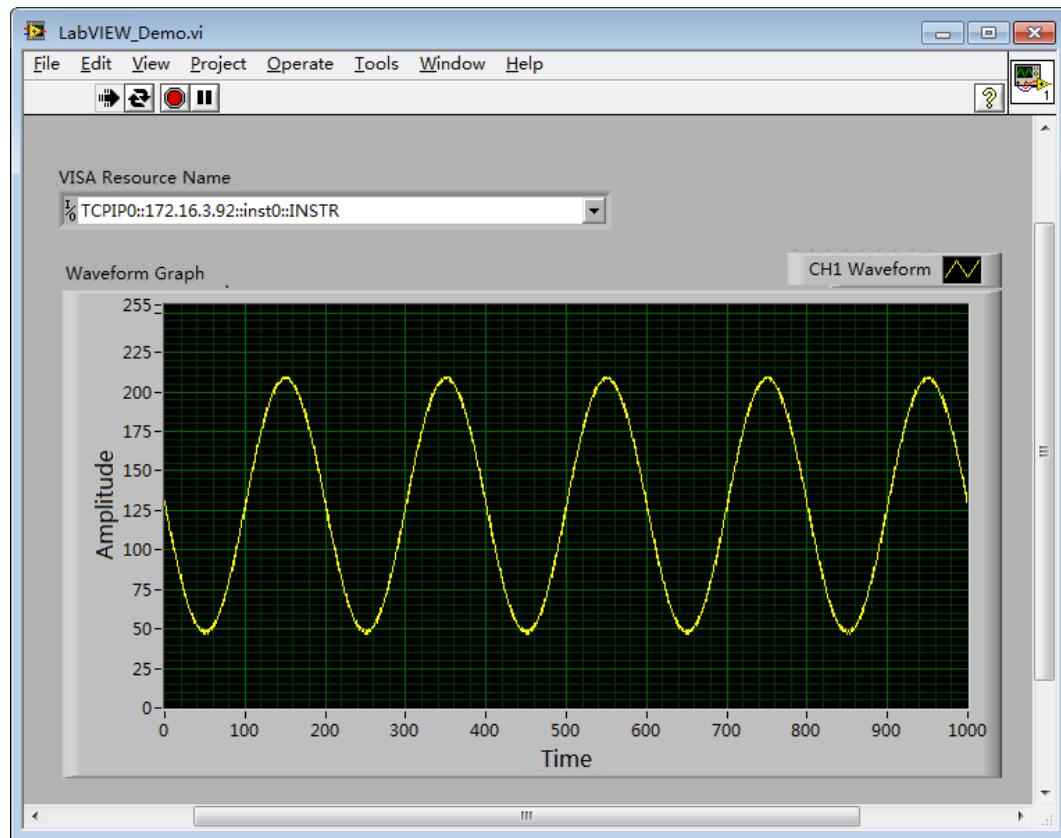

Used to transfer waveform data strings to the byte group

7. The complete program block diagram is as shown in the figure below:

8. Select the device resource from the VISA Resource Name drop-down list and run the program.

## 5.3

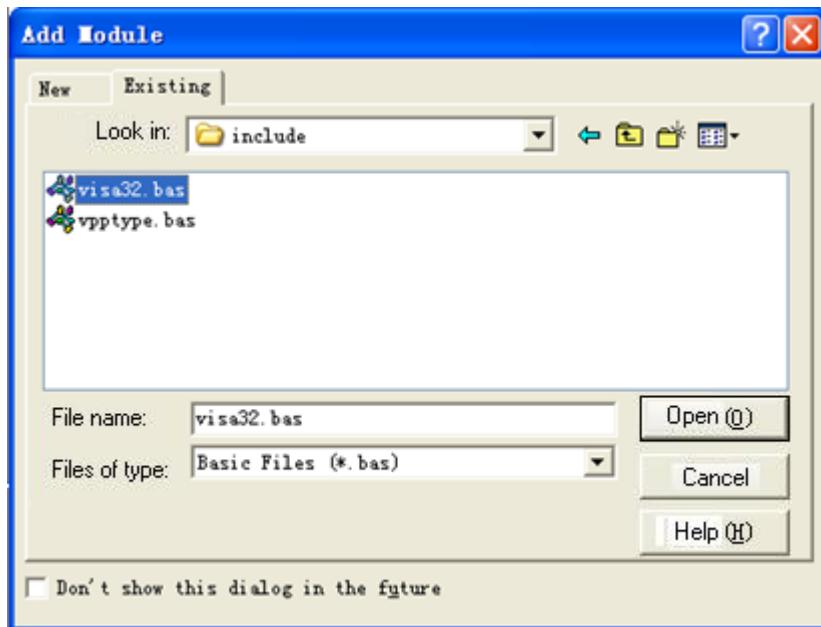

## Visual Basic Programming Example

**Program used in this example:** Visual Basic 6.0

**Function realized in this example:** control the on/off state of any channel.

Enter the Visual Basic 6.0 programming environment, and perform the following procedures.

1. Build a standard application program project (Standard EXE), and name it "Demo".
2. Click **Project > Add Module** to open the Add Module dialog box. In the dialog box, click the Existing tab to search for the **visa32.bas** file in the include folder under the NI-VISA installation path and add the file.

3. In the Demo dialog box, add four buttons to represent CH1 to CH4 respectively. Add four Labels (Label1(0), Label1(1),Label1(2),Label1(3)) to represent the statuses of CH1 to CH4 respectively (when the channel is enabled, it displays the color of the channel; when the channel is disabled, it displays gray), as shown in the figure below.

4. Click **Project > Project1 Properties** to open the Project1 – Project Properties dialog box. In the dialog box, click on the General tab and select **Form1** from the drop-down list under Startup Object.
5. Double-click CH1 to enter the programming environment. Add the following codes to control CH1-CH4. The codes of CH1 are as shown below; the codes of the other channels are similar.

```
Dim defrm As Long
Dim vi As Long
Dim strRes As String * 200
Dim list As Long
Dim nmatches As Long
Dim matches As String * 200 'Reserve the obtained device number
Dim s32Disp As Integer
' Obtain the usb resource of visa
Call viOpenDefaultRM(defrm)
Call viFindRsrc(defrm, "USB?*", list, nmatches, matches)
' Turn on the instrument
Call viOpen(defrm, matches, 0, 0, vi)
```

```

' Send a command to query the status of CH1
Call viVPrintf(vi, ":CHAN1:DISP?" + Chr$(10), 0)
' Obtain the status of CH1
Call viVScanf(vi, "%t", strRes)
s32Disp = CInt(strRes)
If (s32Disp = 1) Then
' Send the setting command
Call viVPrintf(vi, ":CHAN1:DISP 0" + Chr$(10), 0)
Label1(0).ForeColor = &H808080 'Gray
Else
Call viVPrintf(vi, ":CHAN1:DISP 1" + Chr$(10), 0)
Label1(0).ForeColor = &HFFFF& 'Yellow
End If
' Close the resource
Call viClose(vi)
Call viClose(defrm)

```

- 6.** Save and run the project to obtain a single exe program for demo. When the instrument is correctly connected to the PC, you can control the on/off status of any channel.
